

SiteScope is an AI-driven website audit tool that analyzes any public website across five dimensions — security, frontend design, SEO, legal compliance, and cross-dimensional consistency. It produces a structured report identifying issues and risks, categorized by severity and by audience (technical vs. business), within minutes of submission.

WHAT SITESCOPE CHECKS

Dimension	Scope of Analysis
Security	HTTP security headers (HSTS, CSP, X-Frame-Options, etc.), information leakage, technology fingerprinting, SSRF exposure, form security (CSRF, CAPTCHA)
Frontend Design	Meta tags (title, description, Open Graph), WCAG 2.1 Level A accessibility, mobile responsiveness, video autoplay behavior
SEO	robots.txt configuration, sitemap.xml validity, dead links, canonical URLs, search engine indexability
Legal Compliance	Privacy policy presence and completeness, terms of service, cookie consent mechanisms, tracking script disclosure, third-party brand authorization
Cross-Dimensional	Contradictions between dimensions (e.g., privacy policy states no tracking while analytics scripts are detected), consistency of claims vs. implementation

REPORT STRUCTURE

Technical Findings

Issues of primary concern to engineering teams: security vulnerabilities, misconfigured HTTP headers, missing CSP policies, frontend code quality, SEO technical implementation, and development-mode exposure.

Business Findings

Issues of primary concern to product and business teams: legal compliance gaps, privacy policy deficiencies, cookie consent violations, unauthorized third-party assets, brand consistency issues, and user trust implications.

Each finding is assigned a severity level: Critical Requires immediate attention Important Should be addressed soon Minor Suggested improvement

REPORT MODES

Mode	Output
Brief Scan	Lists identified issues and associated risks. Faster generation; suitable for a quick assessment or initial review.
Full Report	Includes all findings from the Brief Scan, plus prioritized remediation recommendations for each issue. Suitable for handing off to development or compliance teams.

HOW IT WORKS

The platform fetches the target site's homepage HTML, HTTP response headers, robots.txt, sitemap.xml, and up to five internal subpages. This data is analyzed by an AI model against the five audit dimensions. The report is streamed to the browser in real time as it is generated.

SiteScope — Platform Features & Use Cases

PLATFORM FEATURES

Feature	Description
Real-Time Streaming	Reports generate live in the browser. Progress indicators show which dimension is currently being analyzed — no need to wait for the full process to complete.
Bilingual Support	Both the interface and audit reports are available in English and Chinese, selectable per request.
Multiple AI Models	Built-in AI models included. Alternatively, connect your own AI provider (OpenAI, Anthropic, DeepSeek, or compatible services) using your own API credentials. Credentials are never stored or logged.
Access Control	Passcode-gated access prevents unauthorized usage. Per-IP rate limiting (default: 10 audits per hour) controls costs and prevents abuse.
Audit Logging	Every scan is logged with requesting IP, target URL, model used, and timestamp — suitable as evidence for internal compliance reviews.
Export Options	Download reports as Markdown files or copy to clipboard for integration into documentation, tickets, or compliance records.

SAFETY & PRIVACY

Measure	What It Means
Passive Scanning Only	The crawler reads publicly available HTML and HTTP headers via GET requests only. It does not submit forms, modify data, or attempt exploitation.
Internal Network Blocking	Requests targeting localhost, private IP ranges, or cloud metadata endpoints are automatically blocked.
No Data Retention	Fetches site data and user-provided API credentials exist only in memory during processing and are discarded immediately after the request completes.
Request Validation	Origin verification prevents cross-site misuse. All inputs are validated before processing.

TYPICAL USE CASES

Scenario	How SiteScope Helps
Pre-Launch Review	Catch security, accessibility, and compliance gaps before a new website or major update goes live.
Vendor Assessment	Evaluate a third-party website or partner portal for security posture and compliance indicators before integration.
Periodic Compliance Check	Verify that privacy policies, cookie consent, and security headers remain properly configured over time.
Competitive Analysis	Compare your site's audit results against competitors to identify areas where your web presence may lag.
Regulatory Readiness	Generate audit evidence for GDPR, CCPA, or Australian Privacy Act compliance reviews.
